

CLOSED LOOP COLOUR

A FASTER MAKE READY + LESS WASTE = QUICK COLOUR APPROVALS

HOW DOES IT WORK?

As an integral part of the press computer operating system, the Closed Loop Colour application scans colour bars printed on the paper and automatically adjusts the ink to pre-determined density targets.

BASED ON ESTABLISHED INDUSTRY STANDARDS

The ink density target ranges are based on SWOP (Standards for Web Offset Printing) and conform to established industry specifications. Dot gain and solid ink densities are part of these standards.

CONSISTENCY THROUGHOUT THE RUN

The Closed Loop System monitors the entire run and automatically makes the appropriate adjustments to ensure the targets are maintained. Manual adjustments can still be made if required for fine-tuning to meet the customer's personal preference. Specifications are stored by job and customer ensuring the same consistency time after time.

ACTUAL PERFORMANCE

"This system generated faster, smoother make-readies. Even better than the sheet fed processes we have used". – Mark Green, Production Manager, Food & Drink Magazine.
